The monarch butterfly and other important pollinators are in decline, but there are ways we can help—even in towns and cities. In summer 2018, organizations in three Illinois municipalities worked with Field Museum scientists to conduct social and ecological research on their local landscape. This summer and fall, we’re working together to build on that research to develop local monarch conservation priorities for these areas.

In this workshop, we’ll share results of the 2018 studies and discuss their implications for the Carbondale area and for this conservation movement overall. Topics include: What tends to work well in monarch conservation planning? How can other municipalities learn and benefit from the research conducted by the Field Museum’s project partners? How can people working on monarch conservation in towns and cities stay connected and learn from one another going forward?
